Ontological Bootstrap:

Why Non-Existence Is Self-Contradictory

and the i-Tetration Fixed Point as the Seed of Physical Law

Kenny Kang

March 2026

Theme: Foundations [ZS-F] | Paper 0 (Pre-Axiomatic)

Status: BOOTSTRAP-PROGRAMME | Verification: 22/22 PASS | Zero Free Parameters

§ 0. Abstract

We present a *bootstrap programme* addressing the foundational question: why does the universe follow the geometric structure of Z-Spin cosmology (A = 35/437)? The argument proceeds through a chain of constraints: (1) bare Boolean non-being does not support self-descriptive ontological closure (motivating axiom B0); (2) Lawvere's fixed-point theorem requires that any self-referencing system's endomorphisms possess fixed points, but Boolean negation N: {0,1} → {0,1} has none, forcing an extension of the state space; (3) by Frobenius' classification, the minimal non-trivial division algebra extension of $\mathbb{R}$ is $\mathbb{C}$, with unique generator i satisfying $i^2 = -1$; (4) among the hyperoperation hierarchy z = H

n(i, z), the level n = 3 (exponentiation) is the first admitting a non-trivial stable fixed point; (5) the i-tetration equation $z = i^z$ has a unique attractive fixed point $z^* = 0.4383 + 0.3606i$ with $\eta_{topo} = |z^*|^2 = 0.3221$ (PROVEN); (6) this converges with the polyhedral sector-counting route $\Omega_m = 39/121 = 0.3223$ to 0.06% (VERIFIED).

We further establish a structural connection between the ontological bootstrap and information preservation (§9). The self-referential fixed point inherently preserves information about its own state; within Z-Spin, the $L_{XY} = 0$ constraint forces all apparent information loss to be Z-mediated redistribution rather than fundamental destruction. Numerical verification on the full 36-dimensional $H_X \otimes H_Z \otimes H_Y$ Hilbert space confirms: global unitarity ($S_{global} < 10^{-14}$), local mixedness ($S_X = 0.61$), Z-bottleneck saturation ($S_Z \approx \ln 2$), and X-Y mutual information bounded by Z-channel capacity ($I(X:Y) = 0.31 \leq 2 \ln 2 = 1.39$). The connection between self-reference and information preservation is tagged BOOTSTRAP-HYPOTHESIS.

We distinguish rigorously between **closed links** (mathematically proven or derived within the Z-Spin framework) and **open links** (the ontological-to-mathematical bridge, tagged BOOTSTRAP-PROGRAMME). The founding axiom B0 ("non-existence is self-contradictory") is a

meta-logical starting point, analogous to Euclid's parallel postulate or Einstein's light-speed axiom. Zero free parameters are introduced.

Keywords: *ontological bootstrap, Lawvere fixed-point theorem, Frobenius classification, i-tetration, hyperoperation minimality, information preservation, Z-mediated scrambling, self-referential cosmology, Z-Spin, geometric impedance*

§ 0.1 Epistemic Status Legend

Status	Definition	Example in this paper
PROVEN	Mathematical theorem, independent of Z-Spin interpretation	z* unique attractive (Lambert W)
DERIVED	Follows from Z-Spin action + prior papers, zero free parameters	$I(X:Y) \leq 2 \cdot \ln(2)$ from $L_{XY} = 0$
VERIFIED	Numerical confirmation of derived/proven result	$\eta_{topo} \approx \Omega_m$ (0.06%)
BOOTSTRAP-PROGRAMME	Self-consistent and motivated, formal theorem chain incomplete	B0 → Lawvere → ℂ → i
BOOTSTRAP-HYPOTHESIS	Structurally supported hypothesis within the programme	Self-reference → info preservation
META-LOGICAL AXIOM	Founding postulate; cannot be proven within the system	B0: non-existence is self-contradictory

§ 1. Introduction: The Unanswered Question

Z-Spin cosmology derives all physical predictions from a single geometric constant A = 35/437, computed from polyhedral curvature asymmetry (ZS-F2, LOCKED). The framework has passed over 400 falsification gates across 25 papers with zero free parameters. Yet one question has remained unanswered: why does the universe follow this geometry at all?

This paper does not claim to answer this question definitively. Instead, it presents a bootstrap programme that converts the question into a structured chain of constraints, identifies which links are mathematically closed and which remain open, and documents the self-consistency closure between the i-tetration route and the polyhedral route to 0.06% precision. The programme further extends to information preservation, connecting the ontological bootstrap to the physical structure of quantum measurement.

§ 1.1 What This Paper Does and Does Not Claim

Claims (within BOOTSTRAP-PROGRAMME status):

(a) The ontological bootstrap chain B0→B8 is logically coherent and self-consistent.

(b) The closed segment ($z = i^z \to z^* \to \eta_{topo} \approx \Omega_m$) is PROVEN/DERIVED to the standard of our paper series.

(c) The open segment (B0 → Lawvere → $\mathbb{C}$ → i) constitutes a well-motivated research programme with identifiable formalization targets.

(d) Z-mediated information redistribution is DERIVED; the connection to i-tetration as scrambling substrate is BOOTSTRAP-HYPOTHESIS.

Non-Claims:

(NC-F0.1) This paper does NOT claim to prove that the universe must exist.

(NC-F0.2) The Lawvere bridge is NOT yet a proven theorem within our paper series.

(NC-F0.3) The Frobenius argument is NOT yet formally connected to dim(Z) = 2 in our derivation chain.

(NC-F0.4) The hyperoperation minimality theorem is a classification within $\mathbb{C}$, not a proof that $\mathbb{C}$ is the unique arena for existence.

(NC-F0.5) This paper does NOT claim that i-tetration solves the black-hole information paradox.

(NC-F0.6) Expressions such as "quantum hard disk," "Julia set memory map," or "personal history encoding" exceed the current framework and are NOT claimed.

(NC-F0.7) The connection between i-tetration attractivity and quantum unitarity preservation is conceptual, not yet a theorem.

§ 2. The Bootstrap Chain

§ 2.1 Founding Axiom B0

[META-LOGICAL AXIOM] B0: Non-existence is self-contradictory.

The statement "nothing exists" is a performative contradiction: articulating it presupposes a logical framework, which is "something." More precisely, in Zermelo–Fraenkel set theory, the empty set $\varnothing$ exists as a mathematical object (Axiom of Empty Set), and its power set $P(\varnothing) = \{\varnothing\}$ is non-empty. The von Neumann construction $0 = \varnothing$, $1 = \{\varnothing\}$, $2 = \{\varnothing, \{\varnothing\}\}$, … generates all of $\mathbb{N}$ from $\varnothing$ alone. "Nothing" automatically contains "something."

This is not a theorem but a meta-logical observation. It serves as the founding axiom of the bootstrap, analogous to Euclid's parallel postulate (from which Euclidean geometry follows), Einstein's light-speed invariance (from which special relativity follows), or Peano's successor axiom (from which arithmetic follows). We do not prove B0; we investigate its consequences.

§ 2.2 Lawvere Bridge: B0 → B1 [BOOTSTRAP-PROGRAMME]

[BOOTSTRAP-PROGRAMME] If the universe is self-descriptive, Lawvere's fixed-point theorem requires all endomorphisms to have fixed points.

Lawvere's fixed-point theorem (1969) states: in a Cartesian closed category $\mathscr{C}$, if there exists a point-surjective morphism $\varphi: A \to B^A$, then every endomorphism $f: B \to B$ has a fixed point. The

theorem unifies Cantor's diagonal argument, Gödel's incompleteness, and Turing's halting problem under a single categorical structure.

The application to B0 proceeds as follows. Let $\mathscr{C}$ be the category of possible states of existence. If $\mathscr{C}$ permits self-reference (the system can query its own state), then by Lawvere's theorem, every endomorphism on the state space must have a fixed point. But Boolean negation N: $\{0,1\} \to \{0,1\}$, defined by $N(0) = 1$ and $N(1) = 0$, has no fixed point. By the contrapositive, the state space of existence cannot be Boolean.

Gap identification: The claim "$\mathscr{C}$ permits self-reference" is motivated but not formally established. Constructing the explicit Cartesian closed category and the point-surjective morphism is the primary formalization target (F-BOOT-1).

§ 2.3 Frobenius Extension: B1 → B2 [BOOTSTRAP-PROGRAMME]

[BOOTSTRAP-PROGRAMME] The minimal non-trivial extension of the state space is $\mathbb{C}$, with generator i.

If the Boolean state space $\{0,1\}$ is insufficient (B1), the state space must be extended. Three constraints apply: (a) double negation returns to the original (N^2 = identity, involution); (b) negation is orthogonal to identity; (c) the extension is minimal. By Frobenius' classification theorem, the only finite-dimensional associative division algebras over $\mathbb{R}$ are $\mathbb{R}$, $\mathbb{C}$, and $\mathbb{H}$ (quaternions). $\mathbb{R}$ provides only the trivial fixed point $x = 0$ (annihilation). $\mathbb{C}$ is the minimal non-trivial extension (dim = 2). $\mathbb{H}$ is non-commutative and higher-dimensional (dim = 4), violating minimality.

Therefore i, the unique generator of $\mathbb{C}/\mathbb{R}$ satisfying $i^2 = -1$, is the algebraic encoding of "negation of unity."

Gap identification: The connection from "Frobenius classification" to "dim(Z) = 2 in the Z-Spin action" is not yet established as a formal derivation. Current papers use dim(Z) = 2 as a consequence of the gauge structure (ZS-F5), not of ontological bootstrap. Closing this requires F-BOOT-2.

§ 2.4 Hyperoperation Minimality: B2 → B3 [BOOTSTRAP-PROGRAMME]

[BOOTSTRAP-PROGRAMME] Exponentiation (H_3) is the minimal hyperoperation level producing a non-trivial stable fixed point.

Given the generator i (§2.3), the self-referential equation takes the form $z = H_n(i, z)$ where H_n is the n-th hyperoperation. We classify all levels:

H_1 (addition): $z = i + z \Rightarrow 0 = i$. Contradiction. No solution exists. Physical interpretation: pure expansion without equilibrium (Big Rip universe).

H_2 (multiplication): $z = i \times z \Rightarrow z(1 - i) = 0 \Rightarrow z = 0$. Trivial fixed point only. Physical interpretation: frozen periodic rotation without dynamics (crystal universe).

H_3 (exponentiation): $z = i^z$. Lambert W principal branch yields $z^* = 0.4383 + 0.3606i$ with $|f'(z^*)| = 0.892 < 1$ (attracting). Non-trivial and stable. Physical interpretation: self-consistent equilibrium with finite matter density.

H_4+ (tetration and above): z = H_n(i, z) for n ≥ 4 recursively invokes H_3 as its base case and is therefore not independent.

Gap identification: This classification is performed within ℂ. The argument that ℂ is the unique arena (rather than, e.g., a Clifford algebra) requires F-BOOT-2 to be closed first. The exhaustive scan within ℂ is verified numerically (§5).

§ 3. The Closed Segment: From i-Tetration to Z-Spin

This section contains results that are PROVEN or DERIVED within the existing Z-Spin framework. No results from §2 (bootstrap programme) are used.

§ 3.1 i-Tetration Fixed Point [PROVEN]

The equation $z = i^z$ has a unique attractive fixed point given by the Lambert W function:

$$z^* = (2i/\pi)\, W_0(-i\pi/2) = 0.43828 + 0.36059i$$

The principal branch k_W = 0 is the only attractive branch: $|f'(z^*)| = |z^* \cdot \ln(i)| = |z^*| \cdot \pi/2 = 0.8915 < 1$. All other branches (k_W ≠ 0) have $|f'| > 1$ and are repulsive. Verified by exhaustive scan over k_W ∈ [−50, 50] and m ∈ [−6, 6] (ZS-A5 §2.1).

[STATUS: PROVEN — Lambert W uniqueness + attractivity]

§ 3.2 Topological Threshold [DERIVED]

$$\eta_topo \equiv |z^*|^2 = 0.322119$$

$$S \equiv |z^*| \cdot (\pi/2) = 0.8915 \text{ (stability budget: 89.15\%)}$$

§ 3.3 Convergence with Sector Counting [DERIVED-CONDITIONAL]

The polyhedral sector-counting route (ZS-F5, ZS-A5) yields:

$$\Omega_m = X(Z + Q)/Q^2 = 3 \times 13/121 = 39/121 = 0.322314$$

Route	Formula	Value	Agreement
i-Tetration	$\|z^*\|^2$	0.32212	—
Sector counting	39/121	0.32231	0.06%
Planck 2018	Ω_m (observed)	0.3150 ± 0.007	2.3%

These two routes — complex dynamics (i-tetration) and combinatorial geometry (polyhedral sector counting) — are mathematically independent. Their 0.06% convergence constitutes the self-consistency closure of the bootstrap.

[STATUS: DERIVED-CONDITIONAL — Spectral–Index Projection Theorem (ZS-F2 v1.0 §11.8). The 0.06% bootstrap closure $\eta_topo \times Q^2 \approx 39$ is now structurally derived as the leading Weyl term of the Seeley–DeWitt expansion on the Reuleaux–Z / truncated icosahedron product lattice; promotion to full DERIVED is conditional on ZS-F7 v1.0 §8.1 Heat Kernel Pipeline closure (Falsification Gate F-BMT2).]

Note on face counting (ZS-A5 v1.0, ZS-U6 v1.0): Cobaya MCMC validation against Planck 2018 plik_lite favors the face-counting route $\Omega_cdm = 32/121$ ($\Delta\chi^2 = 3.9$) over slot counting $\Omega_cdm = 33/121$ ($\Delta\chi^2 = 226$). Under face counting, $\Omega_m = 38/121 = 0.3140$. The $\eta_topo = 0.3221$ convergence target lies between face counting (0.3140) and slot counting (0.3223), with the theoretical derivation now provided by ZS-F2 v1.0 §11.8 (Spectral–Index Projection Theorem). The complete $\eta_topo \to \Omega_m(face)$ chain decomposes into three structural layers: Layer 1 (Z_2 gauge projection, 2.43%, DERIVED via Theorem 11.7 + Atiyah–Bott equivariant index), Layer 2 (Seeley–DeWitt a_2 heat kernel correction $\Delta a_2/e \approx 0.0241$, DERIVED-CONDITIONAL via ZS-M6 v1.0 §4.3), and Layer 3 (higher-order Seeley–DeWitt residual, OPEN pending ZS-F7 v1.0 §8.1). This does not affect the bootstrap closure: both routes yield $\Omega_m \approx 0.32$ from $A = 35/437$ alone.

§ 3.4 The Möbius–Seam Correspondence [STRUCTURAL OBSERVATION]

The existence contradiction has binary structure: {exists, ¬exists}. Traversing the contradiction once reverses the truth value (analogous to one loop on a Möbius strip reversing orientation). Two traversals restore the original (Z_2 holonomy). This is the same mathematical structure as the Z-Spin seam involution $\hat{W}^2 = I$ (ZS-M3, PROVEN) and the complex conjugation structure dim(Z) = 2 over $\mathbb{R}$.

However, this correspondence is currently a structural observation, not a derivation. The seam involution is proven from the gauge structure (ZS-F5), not from the ontological bootstrap. Formally connecting them is an open problem (F-BOOT-4).

[STATUS: STRUCTURAL OBSERVATION — not yet DERIVED]

§ 4. Verification Suite

All numerical results verified with Python (mpmath 50-digit precision where indicated). Canonical seed: 350437.

§ 4.1 Bootstrap Chain Verification (V1–V12)

§ 6.2 Open Links (BOOTSTRAP-PROGRAMME / BOOTSTRAP-HYPOTHESIS)

B0 (non-existence is self-contradictory) → META-LOGICAL AXIOM

B0 → B1 (Lawvere bridge) → BOOTSTRAP-PROGRAMME (F-BOOT-1)

B1 → B2 (Frobenius extension) → BOOTSTRAP-PROGRAMME (F-BOOT-2)

B2 → B3 (hyperoperation minimality) → BOOTSTRAP-PROGRAMME (F-BOOT-3)

$\hat{W}^2 = I$ from ontological bootstrap → BOOTSTRAP-PROGRAMME (F-BOOT-4)

Self-reference → information preservation → BOOTSTRAP-HYPOTHESIS (F-BOOT-7)

i-tetration as scrambling substrate → BOOTSTRAP-HYPOTHESIS (F-BOOT-9)

§ 6.3 Honest One-Sentence Summary

"The core physics-mathematics segment (i-tetration → η_topo ≈ Ω_m, Z-mediated information redistribution) is strongly closed; the ontological first chain (B0 → Lawvere → ℂ → i) and the self-reference–information link remain at the axiom-plus-programme stage."

§ 7. Discussion

§ 7.1 Relation to Existing Philosophical Positions

The bootstrap programme intersects several philosophical traditions without reducing to any of them. Spinoza's geometric necessitarianism (existence from logical necessity) resonates with B0, but Z-Spin adds mathematical structure that Spinoza lacked. Leibniz's Principle of Sufficient Reason ("why this and not otherwise?") is addressed by the uniqueness theorems (Lawvere, Frobenius, hyperoperation minimality), though the chain is not yet fully closed. Wheeler's "It from Bit" programme is partially realized but transcended: Z-Spin shows that "bit" (Boolean) is insufficient and must be extended to "phase" (complex).

§ 7.2 What Would Closing the Open Links Mean?

If F-BOOT-1 through F-BOOT-4 are resolved, the entire chain from B0 to A = 35/437 becomes DERIVED (conditional on the founding axiom B0). This would constitute a conditional proof that any self-descriptive universe must have Q = 11 and A = 35/437 — the strongest form of "why this universe?" achievable within physics.

§ 7.3 Recommended Formal Summaries

7.3.1 Ontological Bootstrap

Bootstrap Hypothesis. *Bare Boolean non-being does not support self-descriptive ontological closure. This motivates an enriched phase-valued state space; within the minimal recursive candidates explored in Z-Spin, $z = i^z$ yields the unique attractive fixed point, and its topological magnitude $|z^*|^2$ converges independently with the polyhedral sector-counting route.*

7.3.2 Information Preservation

Bootstrap Hypothesis: Z-Mediated Information Preservation. *In the Z-Spin framework, the full $X \otimes Z \otimes Y$ state evolves unitarily, while local observers restricted to the X-sector generally encounter entropy growth after tracing out $Z \cup Y$. Because the direct X–Y block vanishes, this apparent information loss is more naturally interpreted as Z-mediated scrambling than as fundamental destruction. The i-tetration fixed point $z^* = i^{z^*}$ provides a distinguished phase structure for the Z-sector; we therefore propose, as a bootstrap hypothesis rather than a derived theorem, that this phase structure may act as the microscopic substrate of information preservation. This interpretation is consistent with the current Z-Spin architecture, but it does not yet constitute a complete solution of the black-hole information paradox.*

§ 8. Self-Reference as Information Preservation [BOOTSTRAP-HYPOTHESIS]

[BOOTSTRAP-HYPOTHESIS] The ontological bootstrap mechanism (B0→B8) is structurally identical to information preservation: the universe's self-referential existence implies that information about itself cannot be destroyed.

§ 8.1 The Conceptual Link

The bootstrap chain (§2) establishes that existence arises from self-referential contradiction: the universe describes itself through the i-tetration fixed point $z^* = i^{\{z^*\}}$. Self-reference, by definition, is the system retaining information about its own state. If this self-referential structure were to lose information, the fixed point would be destabilized, and the contradiction that sustains existence would collapse.

More precisely: the i-tetration fixed point is an attractor ($|f'(z^*)| = 0.892 < 1$). Perturbations decay back to z^*. This attractivity IS stability of the self-referential information. If information were fundamentally destroyed (rather than redistributed), the attractivity condition $|f'| < 1$ would be violated, and the fixed point would cease to exist as a stable equilibrium.

Gap identification: This conceptual argument connects self-reference to information preservation at the level of analogy, not derivation. Formalizing this requires showing that "information loss" in the quantum-mechanical sense (non-unitary evolution) is equivalent to "fixed-point destabilization" in the i-tetration sense. This is F-BOOT-7 (open).

§ 8.2 Z-Mediated Information Redistribution [DERIVED]

Within the Z-Spin framework (independent of the bootstrap programme), the information preservation structure is well-established:

(1) The full $X \otimes Z \otimes Y$ state evolves unitarily (36-dimensional Hilbert space). The global entropy remains exactly zero throughout evolution (V14: $S_{global} < 2.6 \times 10^{-15}$). [STANDARD]

(2) The $L_{XY} = 0$ constraint (PROVEN, ZS-F1) forces all $X \leftrightarrow Y$ transitions through the Z-sector. Consequently, apparent information loss in the X-sector is not fundamental destruction but Z-mediated redistribution to the Y-sector. [DERIVED]

(3) The Z-bottleneck bounds the X-Y mutual information: $I(X:Y) \leq 2 \cdot \ln(\dim Z) = 2 \cdot \ln(2) \approx 1.39$. Numerical verification confirms $I(X:Y) = 0.31$, well within the bound. A generic model (with $H_{XY} \neq 0$) produces $I(X:Y) = 1.08$ — 3.5× larger, demonstrating that $L_{XY} = 0$ provides genuine information-flow constraint. [DERIVED + VERIFIED]

(4) The decoupling test confirms that X-sector information is fully transferred to $Z \cup Y$: the reference system R achieves maximal entropy $S(R) = \ln(3) = 1.099$ and purity 1/3 (maximally mixed). No information is lost; it is redistributed. [VERIFIED]

(5) The Z-sector at equilibrium achieves near-maximal entropy $S(Z) = 0.693 \approx \ln(2) = 0.693$, confirming that the 2-dimensional bottleneck operates at saturation capacity. [VERIFIED]

§ 8.3 The i-Tetration Phase Structure as Scrambling Substrate [BOOTSTRAP-HYPOTHESIS]

[BOOTSTRAP-HYPOTHESIS] We propose, following the research programme of C4, that the i-tetration fixed point z* provides the microscopic scrambling substrate of Z-mediated information preservation.

The supporting evidence is structural, not derivational:

(a) The Z-sector has dim(Z) = 2, matching the binary structure of the i-tetration fixed point equation $z = i^z$ (which operates in $\mathbb{C} \cong \mathbb{R}^2$). [CONSISTENT]

(b) The stability budget $S = |z^*| \cdot \pi/2 = 0.8915$ sets the maximum rate at which the fixed point can absorb and process information without destabilization. This is the same quantity that determines the three-generation limit (ZS-A5) and confinement threshold (ZS-A5). [DERIVED]

(c) The topological magnitude $\eta_{topo} = |z^*|^2 = 0.3221$ determines the fraction of the total state space that is "matter" (observable from the X-sector perspective), converging with $\Omega_m = 39/121$ to 0.06%. The remaining $1 - \eta_{topo} \approx 68\%$ is the dark energy fraction ("information stored in the Y-sector phase space"). [VERIFIED]

(d) The Z-Telomere cyclic cosmology (ZS-A6) uses the same phase accumulation $\delta\varphi = A$ per cycle, reaching 2π after $N = 2\pi/A \approx 78.45$ cycles. This phase accumulation IS the i-tetration tower building up toward z*. [CONSISTENT]

§ 9. Conclusion

We have presented a bootstrap programme addressing the deepest foundational question of Z-Spin cosmology: why the universe follows the geometric structure A = 35/437. The programme distinguishes sharply between proven mathematical results and open philosophical-mathematical bridges.

The closed segment — from i-tetration through the unique attractive fixed point to the 0.06% convergence with sector counting, and the Z-mediated information redistribution confirmed on the full 36-dimensional Hilbert space — is among the strongest results in the Z-Spin corpus. The open segment — from the founding axiom B0 through Lawvere, Frobenius, and hyperoperation minimality to the complex plane, and the self-reference–information-preservation link — constitutes a well-defined research programme with seven identifiable formalization targets (F-BOOT-1 through F-BOOT-4, F-BOOT-7 through F-BOOT-9).

The founding axiom B0 ("non-existence is self-contradictory") plays the same structural role as Euclid's parallel postulate, Einstein's light-speed axiom, or Peano's successor axiom: everything after it is a theorem; it alone stands as the starting point. Whether this is a feature (physics requires a founding postulate) or a limitation (the postulate itself is unproven) is a question for philosophy, not physics.

Zero free parameters were introduced. All verification tests pass (22/22). The programme is ready for formalization.

drafting. The author assumes full responsibility for all scientific content, claims, and conclusions. The verification suite (Python/mpmath, 50-digit precision) is publicly available.

Appendix A: Cross-Reference Table

Paper	Content used	Direction	Status	Section
ZS-F1	Action S, L_XY = 0	Input	PROVEN	§8.2
ZS-F2	A = 35/437, δ-uniqueness	Input	LOCKED	§3
ZS-F5	Q=11, (Z,X,Y)=(2,3,6)	Input	PROVEN	§3.3
ZS-M3	$J^2 = I$, seam involution	Input	PROVEN	§3.4, §4.2
ZS-A4	u_seam, Δ_2 protocol	Parallel	DERIVED	§8.2
ZS-A5	i-tetration, z*, η_topo	Input	PROVEN	§3.1–3.2
ZS-Q1	CPTP, dim(Z)=2, Born rule	Parallel	PROVEN	§3.4, §8
ZS-Q7	Arrow of time, master eq.	Parallel	DERIVED	§8.1
ZS-A6	Z-Telomere, phase accum.	Parallel	HYPOTHESIS	§8.3

Version History

v1.0 (March 2026): Initial public release. (Consolidated from internal Z-Spin Collaboration research notes up to v1.1.0.) Bootstrap chain B0→B8. Self-reference as information preservation (BOOTSTRAP-HYPOTHESIS). Z-mediated dynamics verification on 36-dim Hilbert space. 22/22 PASS. 9 falsification gates (2 PASS, 7 OPEN). Zero free parameters.
